

a)

pected utilities of any of the acts. Savage points this out in *The Foundations of Statistics*. I. J. Good⁸ takes it to be the relevant response to A. J. Ayer's⁹ question about Carnap's principle of total evidence. However, in a more general theory in which the states of the world are not independent of the acts, such as Richard Jeffrey's, the theory fails, a fact that has been recently pointed out by Ernest Adams and Roger Rosenkrantz.¹⁰ Consider Newcomb's paradox. You are faced with two transparent boxes, one bare and one covered with a black cloth. You can see that the bare box contains \$1,000; the covered box contains either 1 million dollars or nothing. You can take either the money under the covered box alone or the money under both. A good predictor has put the million under the
